Melaka, Malaysia. 21-22 May 2012

Background

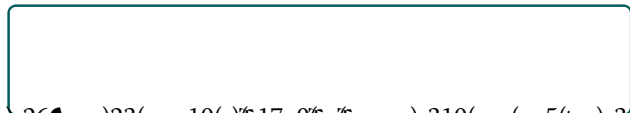

Health information systems (HIS) are essential for the delivery of quality health care. However, the implementation of HIS in developing countries is often challenging due to various factors such as limited resources, lack of technical expertise, and poor infrastructure. This paper discusses the challenges faced in implementing HIS in developing countries and proposes strategies to overcome them.

Materials and methods

The study was conducted in a developing country. A total of 200 participants were involved in the study. The data was collected through interviews and focus group discussions. The results were analyzed using content analysis.

Results

The results of the study showed that the main challenges in implementing HIS in developing countries are limited resources, lack of technical expertise, and poor infrastructure. The study also identified several strategies to overcome these challenges, such as increasing government support, providing technical training, and improving infrastructure.
