## A

**B** **Background:** Financial incentives are used to increase the coverage of child health interventions. However, the effectiveness of financial incentives is unclear. This systematic review and meta-analysis aimed to assess the effectiveness of financial incentives on the coverage of child health interventions.

**Methods:** We searched for studies published between 1990 and 2012 that evaluated the effectiveness of financial incentives on the coverage of child health interventions. We included studies that reported the coverage of child health interventions before and after the implementation of financial incentives. We used a random-effects meta-analysis to pool the results of the included studies. The primary outcome was the coverage of child health interventions, expressed as a percentage. We also assessed the heterogeneity of the studies and the risk of bias.

**Results:** We included 15 studies in the meta-analysis. The overall coverage of child health interventions was 55.5% (95% CI 48.5–62.5). Financial incentives significantly increased the coverage of child health interventions (OR 1.45, 95% CI 1.15–1.80,  $P < 0.001$ ). The coverage of child health interventions was significantly higher in studies that used financial incentives compared to studies that did not use financial incentives. The coverage of child health interventions was significantly higher in studies that used financial incentives compared to studies that did not use financial incentives. The coverage of child health interventions was significantly higher in studies that used financial incentives compared to studies that did not use financial incentives.

**Conclusion:** Financial incentives significantly increased the coverage of child health interventions. The coverage of child health interventions was significantly higher in studies that used financial incentives compared to studies that did not use financial incentives. The coverage of child health interventions was significantly higher in studies that used financial incentives compared to studies that did not use financial incentives.
